## Introduction to the Television School and Family Smoking Prevention and Cessation Project

We will analyse data from the Television School and Family Smoking Prevention and Cessation Project (TVSFP) (Flay et al., 1989). The project was designed to test the effect of two different school-based interventions on student tobacco and health knowledge: (1) A social-resistance classroom curriculum (CC); and (2) A television-based programme.

The study sample involved schools with seventh-grade students (age 12 to 13 years) in Los Angeles and San Diego, California. Schools were randomized to one of the four study conditions formed by crossing the two interventions in a  $2 \times 2$  design.

		Television-based programme (TV)			
		No	Yes		
Classroom	No	Neither intervention	TV only		
Curriculum (CC)	Yes	CC only	CC and TV		

The two interventions were delivered to the seventh-grade students in these schools in spring 1986. Students were baselined in January 1986, completed an immediate postintervention questionnaire in April 1986, a one-year follow-up questionnaire in April 1987, and a two-year follow-up questionnaire in April 1988. At each time point, students' knowledge was assessed using a tobacco and health knowledge scale (THKS), constructed as the number of correct answers to seven binary questionnaire items.

The data were restudied by Hedeker *et al.* (1994) who used them to illustrate the importance of clustering in clinical and public health research and how multilevel models could be used to account for two-level and three-level hierarchical clustering structures. They concentrated on the sub sample of students who studied at 28 Los Angeles schools and only analysed data from the baseline and postintervention time points. Students who missed data at either time point were listwise deleted.

In this Module, we will explore the three-level hierarchical structure of the data: students (level 1) in classrooms (level 2) in schools (level 3). We will fit three-level multilevel models to examine the relative importance of schools and classrooms as influences on student tobacco and health knowledge and we will pay particular attention to assessing the possible causal effects of the CC and TV interventions.

There is good reason to expect both school and classroom effects on students' THKS scores. While schools were randomly assigned to the four study conditions, implementation of the CC and TV interventions were carried out at the classroom level. It seems very likely that some schools and teachers would have been more enthused about the interventions than others and this is likely to have had a direct effect on the success of the interventions. We therefore expect to see both

between-school and within-school-between-classroom variation in students' THKS scores, even after accounting for baseline differences in their tobacco and health knowledge.

We use the Hedeker *et al.* sub sample of the original data. The data consist of 1,600 students (level 1) nested within 135 classrooms (level 2) nested within 28 schools (level 3).

The response variable is students' postintervention THKS. We shall treat this score as a continuous response variable in our multilevel models, though we note that we could equally treat this response as ordinal and therefore fit ordinal response multilevel models (see Module 9). The predictor variables of key interest are the school level binary indicators of whether each school was randomly assigned to the CC or TV interventions. The predictor variables also include students' baseline THKS scores. We will include this predictor variable in our models to adjust for baseline variation in students' tobacco and health knowledge.

The dataset contains the following variables

Variable name	Description and codes
schoolid	School ID
classid	Class ID
studentid	Student ID
postthks	Postintervention THKS score. Scores range from 0 to 7, with a higher score indicating a higher tobacco and health knowledge
prethks	Baseline THKS score. Scores are measured on the same scale as <b>postthks</b> .
СС	Classroom curriculum (CC) (0 = no CC, 1 = CC)
tv	Television (TV) (0 = no TV, 1 = TV)
ccXtv	CC × TV, the interaction between CC and TV. The variable is constructed by multiplying the variables cc and tv. Note that ccXtv is also binary and 1 = both CC and TV and 0 otherwise.

## P11.1 Examining and Describing the Data

Load '11.1.dta' into memory and open the do-file for this lesson

From within the LEMMA learning environment

- Go to Module 11: Three-Level Multilevel Models, and scroll down to Stata files
- Click '11.1.dta' to open the dataset

and use the describe command to produce a summary of the dataset

. describe

Contains dat obs: vars: size:	ta from 11 1,600 8 20,800	.1.dta		25 Jul 2012 14:43
storage dis			label	variable label
schoolid classid studentid postthks prethks cc tv ccXtv	float int byte byte byte byte	%8.0g %12.0g %9.0g %8.0g %8.0g %8.0g %8.0g %8.0g		School ID Class ID Student ID Postintervention THKS Baseline THKS Classroom curriculum (CC) Television (TV) Interaction (CC*TV)
Sorted by:	schoolid	classid		

The data consist of 1,600 observations on 8 variables and each variable has been given a variable label.

Standard univariate summary statistics can be requested using the summarize command

summarize	,

Variable	Obs	Mean	Std. Dev.	Min	Max
schoolid classid studentid postthks prethks	1600   1600   1600   1600   1600	421.9388 422042.3 800.5 2.661875 2.069375	112.6662 112667.2 462.0245 1.382929 1.26018	193 193101 1 0	515 515113 1600 7 6
cc tv ccXtv	+   1600   1600   1600	.476875 .499375 .239375	.4996211 .5001559 .4268354	0 0 0	1 1 1

We see, for example, that the response variable **postthks** ranges from 0 to 7. We shall describe a range of summary statistics for the response and predictor variables in P11.1.2.

#### P11.1.1 Exploring the three-level data structure

We start by using the list command to list the data for the first 10 students in the data. We use the compress option to abbreviate the variable names and to therefore compress the width of the columns in the output. Doing this prevents each line of the output from being wrapped on to a second line and so ensures readability.

. list in 1/10, compress

_	+							
	sch~d	l clas~d	stu~d	pos~s	pre~s	СС	tv	ccXtv
1.	   193	193101	1	2	1	0	0	0
2.	193	193101	2	2	3	0	0	0
3.	193	193101	3	3	0	0	0	0
4.	193	193101	4	2	3	0	0	0
5.	193	193101	5	1	1	0	0	0
6.	193	193101	6	2	2	0	0	0
7.	193	193101	7	4	3	0	0	0
8.	193	193101	8	2	3	0	0	0
9.	193	193101	9	3	3	0	0	0
10.	193	193101	10	3	1	0	0	0
-	+							

We see, for example, that student 1 was taught in class 193101 within school 193. The student scored 1 out of 7 on the THKS at baseline (pre~s) and 2 out of 7 at postintervention (pos~s). The variables cc and tv (and therefore ccXtv) are both zero and so school 193 received neither intervention.
