

Transverse failure initiation – a dilatational stress controlled failure event in the glassy polymer matrix

Leif Asp, Professor, Materials and Computational Mechanics, 2022-09-14

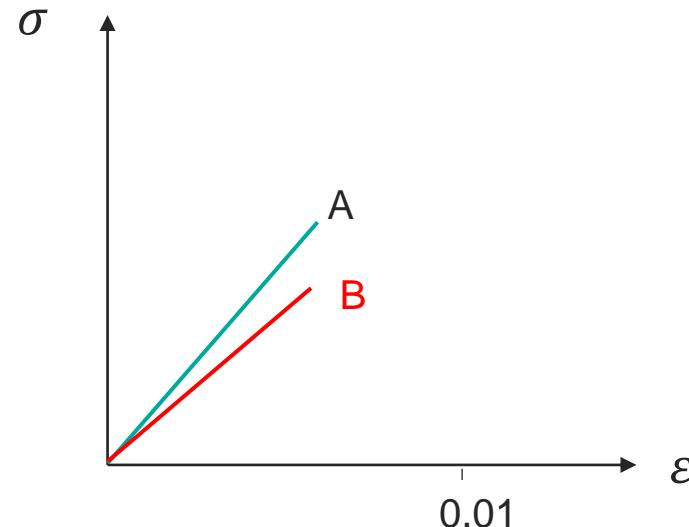

Uniaxial tension of glassy polymers and transverse composites

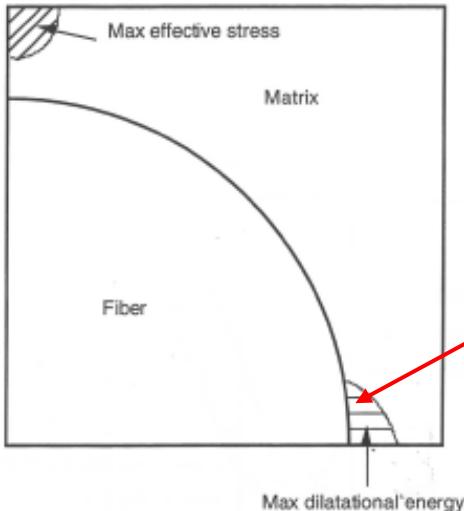

Glassy polymers

Transverse composite

Tensile strength controlled by 3D-stress state

Typical stress state: $\sigma_1 \approx \frac{\sigma_2}{2} \approx \frac{\sigma_3}{2}$, all stresses > 0

Dilatational energy density:

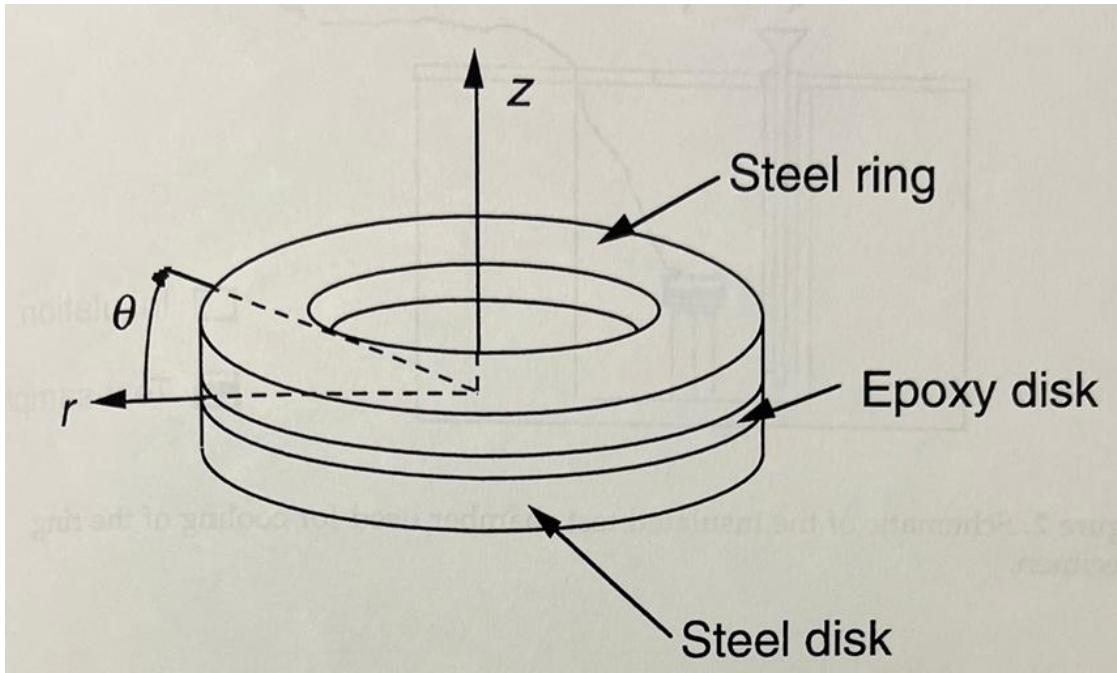

$$U_\nu = \frac{1-2\nu}{6E} (\sigma_1^2 + \sigma_2^2 + \sigma_3^2)$$

(only valid when $\sigma_1 + \sigma_2 + \sigma_3 > 0$)

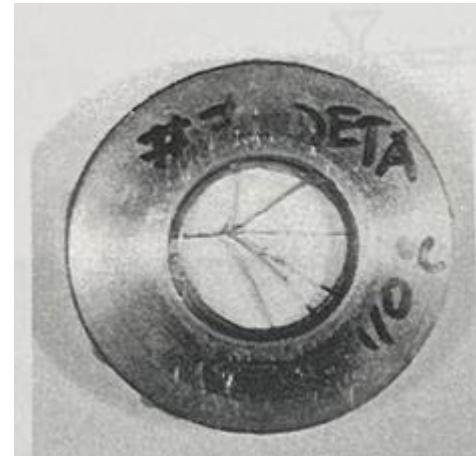

Strength of glassy polymers under dilatational stress

- A way to measure transverse failure initiation

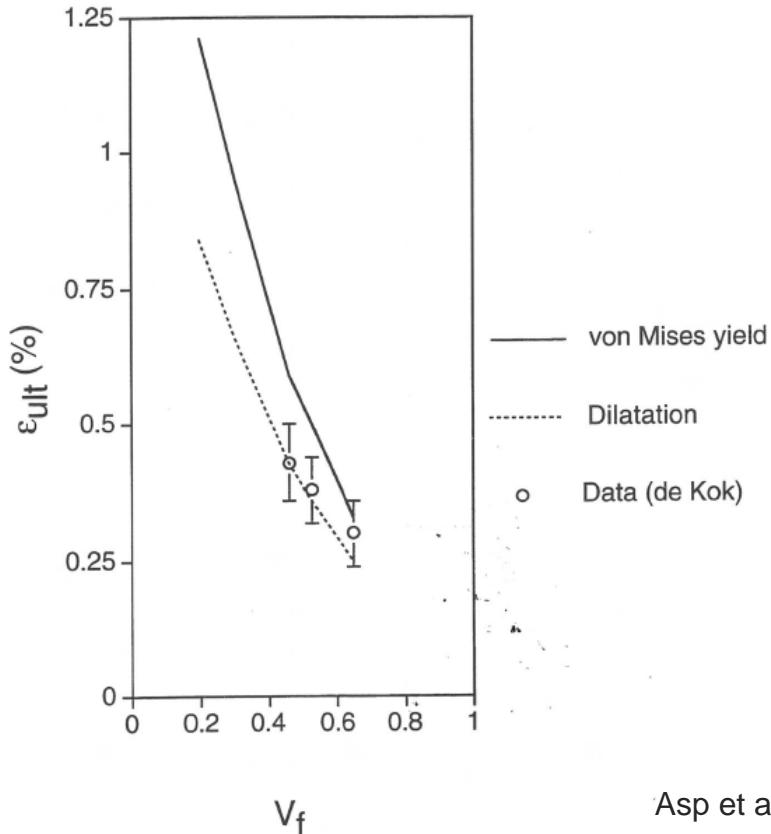

$$\Delta T \approx -200 \text{ } ^\circ\text{C}$$

$$\sigma_r = \sigma_\theta$$
