# Maximising the performance potential of continuous recycled carbon fibre

a holistic approach

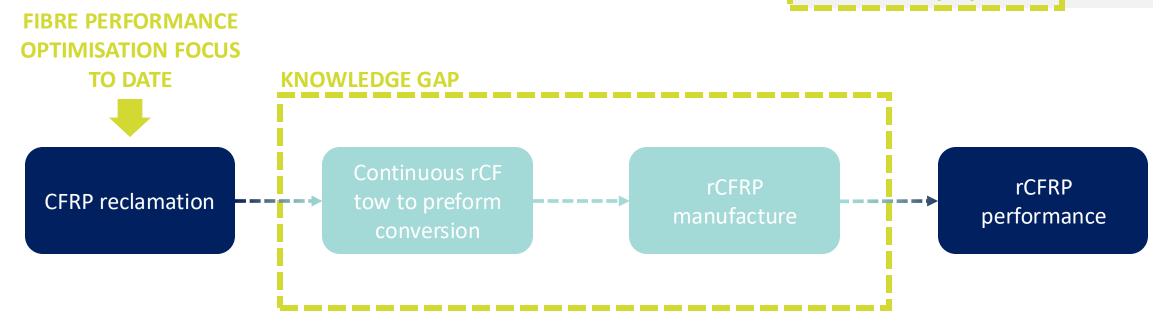

#### What are we missing?

#### **Key measures of rCF performance:**

- Tensile strength and modulus
- Interfacial properties

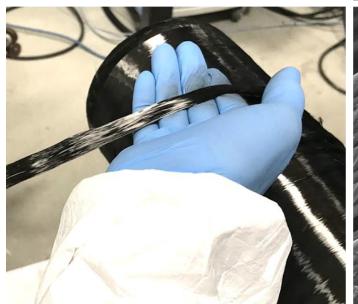

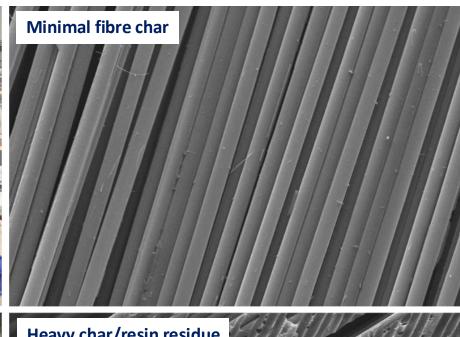

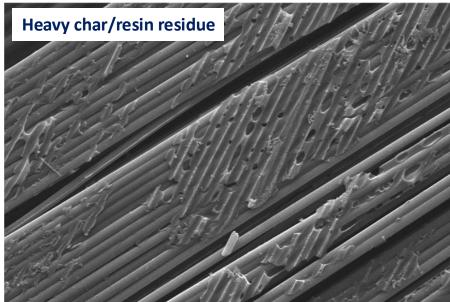

## Supply chain in practice...

"Clean" is not a desirable fibre condition for unwinding continuous, reclaimed fibre from H<sub>2</sub> tanks

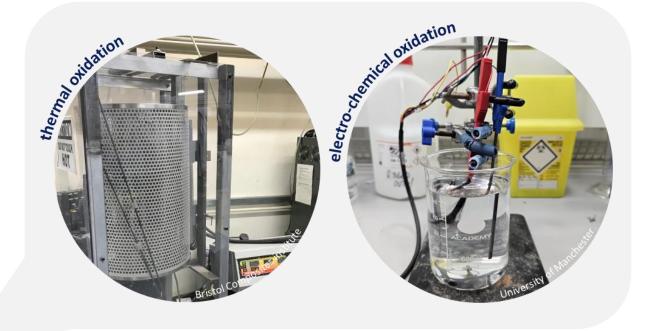

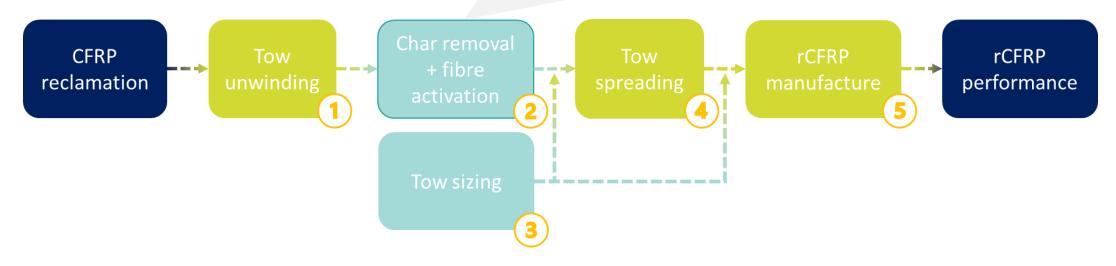

#### **Enabling handling - maximising performance**

### Collaborative opportunities for enabling a circular supply chain

Continuous recycled carbon fibre presents a new material use-case for our existing technologies and expertise in:

- Virgin carbon fibre processing (tow-spreading and sizing)
- Fibre-matrix interface/interphase design

# THANK YOU FOR YOUR ATTENTION
